Review

Validation of macromolecular flexibility in solution by small-angle X-ray scattering (SAXS)

Michal Hammel¹ ✉

Abstract

The dynamics of macromolecular conformations are critical to the action of cellular processes. In this review, we combine solution-scattering data with high-resolution techniques such as, for example, minimal ensemble search (MES), enhance our understanding of the knowledge gained from ensemble X-ray crystallography, NMR, and computational techniques used for conformational sampling. This review addresses theoretical and practical concepts, concerns, and considerations in conjunction with computational methods to productively combine solution-scattering data with high-resolution structures. I discuss the principal means of direct identification of macromolecular conformations from SAXS data followed by critical concerns about the methods used to calculate macromolecular conformations from high-resolution structures. The SAXS profile is a direct interrogation of the macromolecular conformation and techniques such as, for example, minimal ensemble search (MES), enhance our understanding of the knowledge gained from ensemble analysis of SAXS experiments by describing the SAXS profiles as population-weighted thermodynamic ensembles. Recent developments in computational techniques used for conformational sampling provide a basis for assessing the level of the flexibility within a sample. These approaches sacrifice atomic detail, the knowledge gained from ensemble analysis of SAXS data, for the development of hypotheses and guiding biochemical experiments. Examples of the use of these techniques are provided.

首頁

The screenshot shows the SpringerLink homepage with three main sections highlighted by orange rounded rectangles:

- Search Bar:** Located at the top, it includes a search input field with the text "Search", a magnifying glass icon, a settings gear icon, and the Chinese characters "搜索" (Search). To the right of the search bar are links for "Sign up / Log in", "English", and "Academic".
- Browse by discipline:** A vertical list on the left side of the page, containing 20 categories such as "Biomedical Sciences", "Business & Management", "Chemistry", "Computer Science", "Earth Sciences and Geography", "Economics", "Education & Language", "Energy", "Engineering", "Environmental Sciences", "Food Science & Nutrition", "Law", "Life Sciences", "Materials", "Mathematics", "Medicine", "Physics", "Psychology", "Public Health", "Social Sciences", and "Statistics".
- Main Content Area:** The central part of the page features a large banner with the text "Providing researchers with access to millions of scientific documents from journals, books, series, protocols and reference works." Below this banner are two book covers and a purple box that says "New books and journals are available every day." Below the banner is a "Recent Activity" section with a vertical bar on the left. The activity list includes:

EURASIP Journal on Systems Biology

ISSN: (Print) 1687-4153 (Online)

Description

The overall aim of EURASIP Journal on Bioinformatics and Systems Biology is to provide a common platform for the publication of research results related to signal processing and bioinformatics. The journal is intended to offer a common platform for the publication of research results related to signal processing, bioinformatics, statistics, and systems biology.

The screenshot shows the SpringerLink interface for the book 'Multiphase Flow Dynamics 4'. At the top, a blue search bar is highlighted with an orange border, containing the text 'Search within this book' and a magnifying glass icon. Below the search bar, the book's title 'Multiphase Flow Dynamics 4' is displayed, along with the subtitle 'Turbulence, Gas Adsorption and Release, Diesel Fuel Properties'. The author is listed as 'Nikolay Ivanov Kolev'. The ISBNs are provided: 978-3-642-20748-8 (Print) and 978-3-642-20749-5 (Online). A 'Table of contents' section is visible, listing three chapters with their respective page ranges and PDF download links. To the right of the text, a book cover image is shown, featuring the title and a 'LOOK INSIDE' button.

Abstract (3)

We illustrate the use of intersection types as a tool for synthesizing λ -models which exhibit special purpose features. We focus on semantical proofs of *easiness*. This allows us to prove that the class of λ -theories induced by graph models is strictly included in the class of λ -theories induced by non-extensionsal filter models.

Abstract

In vector optimization one investigates optimal elements of a set in a pre-ordered space. The problem of determining these optimal elements, if they exist at all, is called a vector optimization problem. Problems of this type can be found not only in mathematics but also in engineering and economics. There, these problems are also called multiobjective (or multi criteria or Pareto) optimization problems or one speaks of multi criteria decision making. Vector optimization problems arise, for example, in functional analysis (the Hahn–Banach theorem, the lemma of Bishop–Phelps, Ekeland’s variational principle), multiobjective programming, multi-criteria decision making, statistics (Bayes solutions, theory of tests, minimal covariance matrices), approximation theory (location theory, simultaneous approximation, solution of boundary value problems) and cooperative game theory (cooperative n player differential games and, as a special case, optimal control problems). In the last decades vector optimization has been extended to problems with set-valued maps. This field, called set optimization, has important applications to variational inequalities and optimization problems with multivalued data.
